CODE NOW ALSO HOSTED ON GITHUB

SEPTEMBER 29, 2014 | ISRAEL

We have finally hosted our code on Github as well.

This is in hope that more developers will see it, and be willing to contribute to it.

There is still some work to be finished in the Settings Manager to get it ready for the Tori OS release.

The ISO and OS maker scripts still have some work that needs to be finished as well in order to finish the building process.

The maker scripts are almost finished, many issues have been worked out, and many improvements have been made, which brings us much closer to the Beta version. Once this is out we can test it extensively and find any bugs.

Once it is reasonably bug free (i.e. no known issues) we can release it as ToriOS 1.0

The user will have continued support for the duration of the 12.04 LTS, as the jwm PPA and jwm-settings-manager PPA will continue to be updated. Before the Beta the PPAs will be migrated to an 'official' ToriOS PPA, and the builder scripts will be modified accordingly.

Here are the links:

the settings manager
